COVID-19 GLOBAL IMPACT DASHBOARD

ONE-PAGE EXECUTIVE SUMMARY | POWER BI PROJECT

Project Objective

Analyze publicly available COVID-19 data by country and date to explore reported case and death trends, compare country-level impact, and review vaccination indicators through an interactive dashboard.

Dashboard Snapshot

TOTAL CASES SHOWN	TOTAL DEATHS SHOWN	CASE FATALITY MEASURE	AVERAGE DAILY CASES
779M	**7M**	**0.91**	**1.39K**

Snapshot values are transcribed from the dashboard screenshot and depend on selected filters/reporting period. Verify the case fatality measure's formatting before interpreting it as a percentage.

Key Findings

- The dashboard displays approximately 779 million total cases and 7 million total deaths in its current view.
- The case-trend visual shows a prominent peak around 2022, followed by lower values in the later years shown.
- Country comparison charts rank countries by total cases, fully vaccinated people, and cases per million.
- Cases per million helps compare countries with different population sizes, although reporting completeness can vary.

Data Preparation & Assumptions

The dataset was imported into Power BI and reviewed in Power Query. Country/date fields and numerical COVID-19 indicators were used to build KPI cards and trend/comparison visuals. Missing values should not automatically be treated as zero unless justified. Country comparisons should consider population size and reporting completeness. Results reflect the dataset's reporting period and the filters selected in the dashboard.

Tools & Deliverables

Tools: Power BI Desktop, Power Query, and DAX. **Deliverables:** interactive dashboard, dataset documentation, key findings, and this executive summary.

Conclusion: The dashboard provides an interactive overview of global COVID-19 trends and supports country-level exploration. The visual comparisons are descriptive and do not establish causation.
